

Apart from the requirement, I added a teleporter which is the only way to come back to starting point. I also made a little parkour with the platforms which will need a little brain work to finish. This one took me the whole day to finish since I didn't write well for the initial codes like character standing, character jumping etc... I added one property for cloud which made the cloud moving across the frame. For that, I made the clouds appear from both directions. Also, the objective of the game I created was to collect every collectable and touch the flag. In terms of learning this course, I could catch 80% of it but still applying and implementing that to our own project is still hard for me since I went for different approach from the start and some segments have huge differences compared to the code in tutorial video. For some segments, I went with pure logic, so they term to work individually but when combine with other code, I need to debug a lot and that was a bit exhausting. For example, in drawMountain, I tried to find the way of how I could adjust the overall size by changing one variable but that took me very long time since I drew my mountain with the most numbers of shapes compared to other objects. Before JS, I had learnt some Programming Languages so learning this give me some clues about how web interaction games worked.
